

Design Guide For The Practical

You're making a quick, 3-slide presentation based upon the mars.html file given to you in the Buddy Drive.

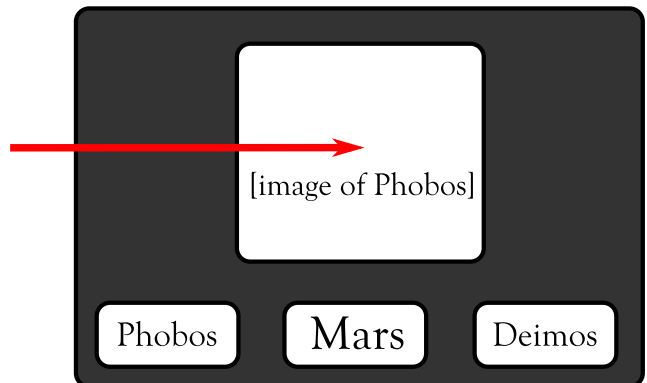

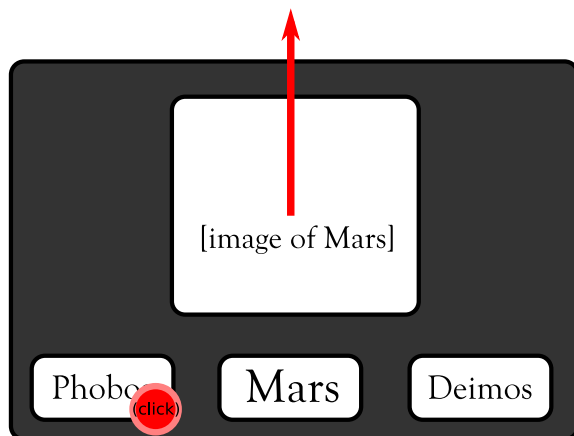

The Opening Screen

The Begin button must be centered on the canvas. The the background image must be in place throughout this presentation.

The First Display

The three buttons animate() up from the bottom of the screen into place, and the picture of Mars animate()s down from the top of the screen to the center. The swish sound must be played. (It's more like a "ping," actually.)

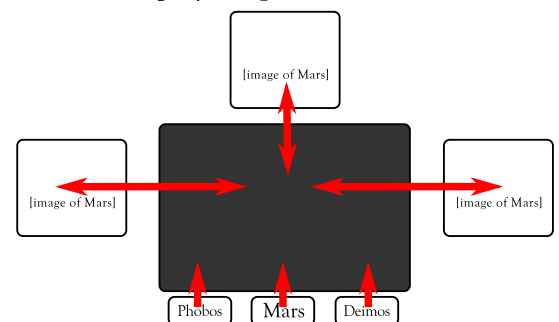

Subsequent Displays

Clicking on each of the buttons will animate the current image off screen in the appropriate direction (Phobos to the **left**, Deimos to the **right**, and Mars **up**) while sliding the current image to the center (Phobos in **from the left**, Deimos **from the right**, Mars **from the top**). And the swish sound must be played again.

Tips:

If you set up all of the buttons and images off screen to begin with and code each state as a different function that simply animate()s all of the pieces on or off the screen, regardless of where they are to start with, this will save you a lot of time.

Bonus Points:

Once you have the basic functionality implemented, any embellishments will be considered for extra credit.
